

REQUEST FOR RECONSIDERATION UNDER RULE 116
Appl. No. 09/381,839

Listing of Claims:

1.-3. (Canceled)

4. (Previously Presented) A method for identification of an object having an object surface, said method comprising:

illuminating a digital micro-mirror arrangement via a light source;
successively projecting a number of encoded illumination patterns by driving said digital micro-mirror arrangement to sequentially illuminate said object surface, with the digital micro-mirror arrangement being sequentially illuminated with at least three colors in a beam path through a variable color filter onto said object surface for identification of at least three depth planes of said object in a single image;

registering said image of said object with a color camera from a direction different from said beam path;

determining a three-dimensional image of a topography of said object surface from said registration in a control and evaluation unit, the determining including the use of at least triangulation principles; and

evaluating the three-dimensional image and a two-dimensional image of said object.

5. (Previously Presented) The method according to claim 4, wherein said encoded illumination patterns comprise a stripe pattern having successively varied periodicity.

6. (Previously Presented) The method according to claim 4, wherein said method is used for face identification.

REQUEST FOR RECONSIDERATION UNDER RULE 116
Appl. No. 09/381,839

7. (Previously Presented) A method for identification of an object having an object surface, said method comprising:

illuminating a digital micro-mirror arrangement via a light source;
successively projecting a number of encoded illumination patterns by driving said digital micro-mirror arrangement to sequentially illuminate said object surface, with the digital micro-mirror arrangement being sequentially illuminated with at least three colors in a beam path through a variable color filter onto said object surface for identification of at least three depth planes of said object in a single image;

registering said image of said object with a color camera from a direction different from said beam path;

determining a three-dimensional image of a topography of said object surface from said registration in a control and evaluation unit, the determining including the use of at least triangulation principles; and

comparing the three-dimensional image to pre-stored data.
